AB - J02233793 Artificial snow is prepd. by freezing gelled matter obtd. by
allowing polyhydric alcohol and/or polyvalent organic acid and
polyvalent-metal to react with water. Polyhydric alcohol and/or
polyvalent organic acid, to improve durability of artificial snow by
preventing it from freeze-drying and to improve its stability by
preventing ice crystals from growing and by decreasing sublimation
speed of ice, is pref., alginic acid, sodium alginate, methyl
cellulose, polyacrylic acid or polyvinyl alcohol. Polyvalent metal is
e.g. polyvalent metallic salt such as CaCl₂, BaCl₂, StrCl₂, or CaCO₃.
- USE/ADVANTAGE - The artificial snow has high cold insulating property
because of its high stability of structure. It is economically
profitable, because energy to maintain it is reduced. (4pp Dwg.No.0/0)
